- 2 Result for the Navier-Stokes system
- 3 Extension: Boussinesq system

Navier-Stokes in a bounded domain

- Ω bounded connected regular open subset of \mathbf{R}^N (N = 2 or 3)
- *T* > 0
- $\omega \subset \Omega$ (control set), $Q := \Omega \times (0, T)$, $\Sigma := \partial \Omega \times (0, T)$

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = v \mathbb{1}_{\omega}, \ \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 & \text{in } \Omega, \end{cases}$$
(NS)

where v stands for the control which acts over the set ω .

Controllability problem: Can we drive the solution of (NS) to a given state at time T by means of a control $\mathbf{v} \in L^2(\omega \times (0, T))^N$?

Because of regularization, we cannot expect exact controllability.

Exact controllability to trajectories

Consider the uncontrolled solution to the same equation:

$$\begin{cases} \bar{y}_t - \Delta \bar{y} + (\bar{y} \cdot \nabla) \bar{y} + \nabla \bar{p} = 0, \ \nabla \cdot \bar{y} = 0 & \text{in } Q, \\ \bar{y} = 0 & \text{on } \Sigma, \\ \bar{y}(0) = \bar{y}^0 & \text{in } \Omega. \end{cases}$$

Exact controllability to trajectories: Given an initial condition y^0 , can we find v such that

$$y(T)=\bar{y}(T)$$
?

Local exact controllability to trajectories: If $||y^0 - \bar{y}^0||$ is small enough, can we find v such that

$$y(T)=\bar{y}(T)$$
?

<u>Remark</u>: After time T, we can "turn off" the control and follow the ideal trajectory.

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	000000		0000000
C	1.		

Some results

Under regularity assumptions on \bar{y}

- [Imanuvilov 2001]

Improvements in:

- [Fernández-Cara, Guerrero, Imanuvilov, Puel, 2004]
- [Imanuvilov, Puel, Yamamoto, 2012]: $ar{y} \in L^\infty(\mathcal{Q})$

Method of proof

- Linearization around \bar{y} .
- Null controllability of the linearized problem.
- Fixed point or inverse mapping theorem for the nonlinear problem.

Reduced number of controls

Now we consider:

$$y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, v_2, 0)\mathbb{1}_{\omega}, \ \nabla \cdot y = 0, \ y|_{\Sigma} = 0$$

Some results:

- First results by Fernández-Cara, Guerrero, Imanuvilov, Puel (2006): Local exact controllability to the trajectories when *w* ∩ ∂Ω ≠ Ø.
- Null component depends on this geometric assumption.
- We are interested in removing this geometric property.
- Coron, Guerrero (2009): Null controllability of the Stokes system for a general $\omega\subset\Omega$

$$y_t - \Delta y + \nabla p = (v_1, v_2, 0) \mathbb{1}_{\omega}, \, \nabla \cdot y = 0, \, y|_{\Sigma} = 0$$

Controllability, observability and Carleman estimates

We consider the adjoint system

$$-\varphi_t - \Delta \varphi + \nabla \pi = 0, \ \nabla \cdot \varphi = 0, \ \varphi|_{\Sigma} = 0$$

Null controllability is equivalent to the Observability inequality

$$\int_{\Omega} |\varphi(0)|^2 dx \leq C \iint_{\omega \times (0,T)} (|\varphi_1|^2 + |\varphi_2|^2) dx dt, \quad \varphi = (\varphi_1, \varphi_2, \varphi_3).$$

Important tool: Carleman estimates

$$\iint_{Q} \rho_1(\mathsf{x},t) |\varphi|^2 d\mathsf{x} \, dt \leq C \iint_{\omega \times (0,T)} \rho_2(\mathsf{x},t) (|\varphi_1|^2 + |\varphi_2|^2) d\mathsf{x} \, dt$$

 ρ_1 , ρ_2 some positive weight functions, *C* independent of φ .

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	000000		0000000

How to prove this type of Carleman estimate?

If $\overline{\omega} \cap \partial \Omega \neq \emptyset$:

• From an estimate of the type

$$\iint_{Q} \rho_{1}(x,t) |\varphi|^{2} dx dt \leq C \iint_{\omega \times (0,T)} \rho_{2}(x,t) |\varphi|^{2} dx dt$$

we can use $\varphi|_{\Sigma} = 0$ and $\nabla \cdot \varphi = 0$ to estimate φ_3 by φ_1 and φ_2 .

- This estimate was proved in [Imanuvilov, 2001], [Fernández-Cara, Guerrero, Imanuvilov, Puel, 2004] for a general ω ⊂ Ω.
- The main difficulty is estimating de pressure.

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
000000			

<u>General case $\omega \subset \Omega$ </u>: Method introduced in [Coron, Guerrero, 2009]:

- $\nabla \cdot \varphi = \mathbf{0} \Rightarrow \Delta \pi = \mathbf{0},$
- Look at the (heat) equations satisfied by $\nabla \Delta \varphi_1$ and $\nabla \Delta \varphi_2$ and apply suitable Carleman estimates (doing this eliminates the pressure),
- Use $\varphi|_{\Sigma} = 0$ and $\nabla \cdot \varphi = 0$ to recover φ_3 in the LHS,
- Regularity estimates for the Stokes system to estimate the boundary terms.

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	●00000	O	
Navier-	Stokes system		

We deal with the local null controllability of

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, v_2, 0) \mathbb{1}_{\omega}, \ \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 & \text{in } \Omega, \end{cases}$$

with no assumption on the control domain $\emptyset \neq \omega \subset \Omega$.

Theorem (Guerrero, C., 2013, JMFM)

For every T > 0 and $\omega \subset \Omega$, the NS system is locally null controllable by controls $v_1, v_2 \in L^2(\omega \times (0, T))$.

• We can also choose $v = (v_1, 0, v_3)$ or $v = (0, v_2, v_3)$.

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	○●○○○○	O	
Method	of proof		

• Linearization around zero

$$y_t - \Delta y + \nabla p = f + (\mathbf{v}_1, \mathbf{v}_2, \mathbf{0}) \mathbb{1}_{\omega}, \, \nabla \cdot y = \mathbf{0}, \, y|_{\Sigma} = \mathbf{0}$$

Null controllability of the linearized system (Main part of the proof).
 Main tool: Carleman estimate for the adjoint system

$$-\varphi_t - \Delta \varphi + \nabla \pi = \mathbf{g}, \, \nabla \cdot \varphi = \mathbf{0}, \, \varphi|_{\Sigma} = \mathbf{0}$$

There exists a constant C > 0 (depending on Ω , ω , T)

$$\int_{Q} \rho_1(t) |\varphi|^2 \leq C \Bigg(\int_{Q} \rho_2(t) |\boldsymbol{g}|^2 + \int_{\omega \times (0,T)} \rho_3(t) (|\varphi_1|^2 + |\varphi_2|^2) \Bigg)$$

Inverse mapping theorem for the nonlinear system

$$\mathcal{A} = (y_t - \Delta y + (y \cdot \nabla)y + \nabla p - (v_1, v_2, 0)\mathbb{1}_{\omega}, y(0))$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Result for the Navier-Stokes system

Extension: Boussinesg system

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

What is different with the Stokes case?

- $g \neq 0$.
- $\Delta \pi \neq 0$.
- Applying $\nabla \Delta \cdot$ is more difficult now, since g is not regular.
- We overcome this by separating φ in $\varphi^{g} + \varphi^{i}$, with φ^{g} not regular and φ^i very regular.

Extension: Boussinesq system

Insensitizing controls for the Navier-Stokes system

Null controllability of the linear system

We need weights that do not vanish at
$$t = 0$$
.
Let

$$\widetilde{
ho}_i(t) = \left\{ egin{array}{cc}
ho_i(T/2) & 0 \leq t \leq T/2, \
ho_i(t) & T/2 < t \leq T. \end{array}
ight.$$

$$\|\varphi(0)\|_{L^2(\Omega)^2}^2 + \int\limits_Q \widetilde{\rho_1}(t) |\varphi|^2 \leq C \left(\int\limits_Q \widetilde{\rho_2}(t) |g|^2 + \int\limits_{\omega \times (0,T)} \widetilde{\rho_3}(t) (|\varphi_1|^2 + |\varphi_2|^2) \right)$$

This is proved using classical energy estimates for Stokes and the previous Carleman inequality.

	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	000000		0000000

Recall the linear system:

$$\begin{cases} y_t - \Delta y + \nabla p = f + (v_1, v_2, 0) \mathbb{1}_{\omega}, \ \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 & \text{in } \Omega. \end{cases}$$

lf

$$\iint_Q \widetilde{\rho_1^{-1}} |f|^2 < +\infty,$$

then we can prove that there exists controls v_1, v_2 such that y(T)=0. Furthermore,

$$\iint_{Q} \widetilde{\rho_{2}^{-1}} |y|^{2} + \iint_{Q} \widetilde{\rho_{3}^{-1}} (|v_{1}|^{2} + |v_{2}|^{2}) \mathbb{1}_{\omega} < +\infty,$$

which gives that y goes to zero at T exponentially (so do the controls).

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

n Result for the Navier-Stokes system ○ 00000● Extension: Boussinesq system

Insensitizing controls for the Navier-Stokes system

Controllability of the NS system

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, v_2, 0) \mathbb{1}_{\omega}, \ \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 & \text{in } \Omega. \end{cases}$$

We consider the operator:

 $\mathcal{A}(y, p, v_1, v_2) = (y_t - \Delta y + (y \cdot \nabla)y + \nabla p - (v_1, v_2, 0)\mathbb{1}_{\omega}, y(0))$

 \mathcal{A} is C^1 between weighted spaces (where in particular | y(T)=0 |).

$$\mathcal{A}'(0,0,0,0)(y,p,v_1,v_2) = (y_t - \Delta y + \nabla p - (v_1,v_2,0)\mathbb{1}_{\omega},y(0))$$

is surjective by the null controllability of the linear system. Inverse mapping theorem around (0, 0, 0, 0) gives the result for NS, i.e., there exists $\delta > 0$ such that if $||y^0|| < \delta$, then there exists (y, p, v_1, v_2) such that

$$\left| \mathcal{A}(y, p, v_1, v_2) = (0, y^0) \right|.$$

	Result for the Navier-Stokes system	Extension: Boussinesq system	
0000000	000000	•	000000

Insensitizing controls for the Navier-Stokes system

э

Extension: Boussinesq system

Now we consider the Boussinesq system:

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, 0, 0)\mathbb{1}_{\omega} + (0, 0, \theta), \ \nabla \cdot y = 0 & \text{in } Q, \\ \theta_t - \Delta \theta + y \cdot \nabla \theta = v_0 \mathbb{1}_{\omega} & \text{in } Q, \\ y = 0, \ \theta = 0 & \text{on } \Sigma, \end{cases}$$

$$y(0) = y^0, \theta(0) = \theta^0$$
 in Ω .

Theorem (C., 2013, MCRF)

For every T > 0 and $\omega \subset \Omega$, the Boussinesq system is locally controllable to the trajectory $(0, \bar{p}, \bar{\theta})$ by controls $v_0, v_1 \in L^2(\omega \times (0, T))$, where

$$\begin{cases} \nabla \bar{p} = \bar{\theta} \, e_3 & \text{ in } Q, \\ \bar{\theta}_t - \Delta \bar{\theta} = 0 & \text{ in } Q, \\ \bar{\theta} = 0 \text{ on } \Sigma, \bar{\theta}(0) = \bar{\theta}^0 & \text{ in } \Omega. \end{cases}$$

- We can also choose $v = (0, v_2, 0)$.
- For N = 2, $v \equiv 0$: No control is needed in the fluid equation.

Insensitizing controls for Navier-Stokes system

We consider the problem of insensitizing controls for the NS system:

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = f + \mathbf{v} \mathbb{1}_{\omega}, \, \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 + \tau \widehat{y}^0 & \text{in } \Omega, \end{cases}$$

where τ is a small constant and $\|\hat{y}^0\|_{L^2(\Omega)^3} = 1$. Both are unknown. **Insensitizing control problem:** To find a control $v \in L^2(\omega \times (0, T))^3$ such that the functional (Sentinel)

$$J(y) = \iint_{\mathcal{O} imes (0,T)} |y|^2 \, dx \, dt, \, \mathcal{O} \subset \Omega \ ext{(Observation set)}$$

is not affected by the uncertainty of the initial data, that is,

$$\left.\frac{\partial J(y)}{\partial \tau}\right|_{\tau=0} = 0, \, \forall \widehat{y}^0 \in L^2(\Omega)^3 \text{ s.t. } \|\widehat{y}^0\|_{L^2(\Omega)^3} = 1.$$

We are interested in controls with one vanishing component.

on Result for the Navier-Stokes system

Extension: Boussinesq system

Insensitizing controls for the Navier-Stokes system

A cascade Navier-Stokes system

The previous condition is equivalent to the following null controllability problem: To find a control $v = (v_1, v_2, 0)$ such that z(0) = 0, where

$$\begin{cases} w_t - \Delta w + (w \cdot \nabla)w + \nabla p^0 = f + (v_1, v_2, 0)\mathbb{1}_{\omega}, \nabla \cdot w = 0 & \text{in } Q, \\ -z_t - \Delta z + (z \cdot \nabla^t w) - (w \cdot \nabla)z + \nabla q = w\mathbb{1}_{\mathcal{O}}, \nabla \cdot z = 0 & \text{in } Q, \\ w = z = 0 & \text{on } \Sigma, \\ w(0) = y^0, z(T) = 0 & \text{in } \Omega. \end{cases}$$

Theorem (Gueye, C., 2013, to appear in JMPA) Assume $y^0 = 0$ and $\mathcal{O} \cap \omega \neq \emptyset$. There exists $\delta > 0$ such that if $\|e^{K/t^{10}}f\|_{L^2(Q)^3} < \delta$, there exist a controls $v_1, v_2 \in L^2(\omega \times (0, T))$ such that z(0) = 0.

• We can also choose: $v = (v_1, 0, v_3)$ or $v = (0, v_2, v_3)$.

Result for the Navier-Stokes system

Same strategy as before

Null controllability of the linearized system around 0:

$$\begin{cases} w_t - \Delta w + \nabla p^0 = f^0 + (v_1, v_2, 0) \mathbb{1}_{\omega}, \, \nabla \cdot w = 0 & \text{in } Q, \\ -z_t - \Delta z + \nabla q = f^1 + w \mathbb{1}_{\mathcal{O}}, \, \nabla \cdot z = 0 & \text{in } Q, \\ w = z = 0 & \text{on } \Sigma, \\ w(0) = 0, \, z(T) = 0 & \text{in } \Omega, \end{cases}$$

where f^0 and f^1 decrease exponentially to zero at t = 0.

• The control acts on z through w.

Introduction	Result for the Navier-Stokes system	Extension: Boussinesq system	Insensitizing controls for the Navier-Stokes system
0000000	000000		0000000

As before, we want to show an estimate of the form

$$\begin{split} \iint_{Q} \rho_{1}(t)(|\varphi|^{2} + |\psi|^{2}) &\leq C \left(\iint_{Q} \rho_{2}(t)(|g^{0}|^{2} + |g^{1}|^{2} + |\nabla g^{1}|^{2}) \right. \\ &+ \iint_{\omega \times (0,T)} \rho_{3}(t)(|\varphi_{1}|^{2} + |\varphi_{2}|^{2}) \right) \end{split}$$

where $(\varphi, \psi) = (\varphi_1, \varphi_2, \varphi_3, \psi)$ is the solution of the adjoint system:

$$\left\{ \begin{array}{ll} -\varphi_t - \Delta \varphi + \nabla \pi = g^0 + \psi 1\!\!\!\! 1_{\mathcal{O}}, & \text{ in } Q, \\ \psi_t - \Delta \psi + \nabla \kappa = g^1, & \text{ in } Q, \\ \nabla \cdot \varphi = \nabla \cdot \psi = 0, \text{ in } Q, \varphi = \psi = 0 \text{ on } \Sigma \\ \varphi(T) = 0, \psi(0) = \psi^0 & \text{ in } \Omega. \end{array} \right.$$

• $g^1 \in L^2(0, T; H^1_0(\Omega)^3)$ with $\nabla \cdot g^1 = 0$.

Perspectives, open problems

• What about controllability to trajectories for Navier-Stokes? Adjoint equation:

$$-\varphi_t - \Delta \varphi + \bar{\mathbf{y}} \cdot \mathbf{D} \varphi + \nabla \pi = g.$$

Problem: The components of φ are mixed.

- What about two vanishing components, e.g., $v = (v_1, 0, 0)$?. [Coron, Lissy, 2013]: Return method.
- Boundary controllability with one vanishing component (taking the trace of an extended controlled solution does not work).
