# Outline

- 1 Introduction
- 2 Result for the Navier-Stokes system
- 3 Boussinesq system
- 4 Insensitizing controls for the Navier-Stokes system

Framework:

- $\Omega$  bounded connected regular open subset of  $\mathbf{R}^N$  ( $N = 2$  or  $3$ )
- $T > 0$
- $\omega \subset \Omega$  (control set),  $Q := \Omega \times (0, T)$ ,  $\Sigma := \partial\Omega \times (0, T)$

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = v \mathbb{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega, \end{cases} \quad (\text{NS})$$

where  $v$  stands for the control which acts over the set  $\omega$ .

**Controllability problem:** Can we drive the solution of (NS) to a given state at time  $T$  by means of a control  $v \in L^2(\omega \times (0, T))^N$ ?

Because of regularization, we cannot expect exact controllability.

# Exact controllability to trajectories

Consider the uncontrolled solution to the same equation:

$$\begin{cases} \bar{y}_t - \Delta \bar{y} + (\bar{y} \cdot \nabla) \bar{y} + \nabla \bar{p} = 0, \nabla \cdot \bar{y} = 0 & \text{in } Q, \\ \bar{y} = 0 & \text{on } \Sigma, \\ \bar{y}(0) = \bar{y}^0 & \text{in } \Omega. \end{cases}$$

**Exact controllability to trajectories:** Given an initial condition  $y^0$ , can we find  $v$  such that

$$\boxed{y(T) = \bar{y}(T)} ?$$

**Local exact controllability to trajectories:** If  $\|y^0 - \bar{y}^0\|$  is small enough, can we find  $v$  such that

$$\boxed{y(T) = \bar{y}(T)} ?$$

**Remark:** After time  $T$ , we can “turn off” the control and follow the ideal trajectory.

# Some results

Under regularity assumptions on  $\bar{y}$

- [Fursikov, Imanuvilov 1998, 1999]

Improvements in:

- [Fernández-Cara, Guerrero, Imanuvilov, Puel, 2004]
- [Imanuvilov, Puel, Yamamoto, 2011]

# Reduced number of controls

**Question:** Can we find a control  $v \in L^2(\omega \times (0, T))^N$  with a vanishing component, for example,

$$v = (v_1, 0) \quad \text{or} \quad v = (v_1, v_2, 0) \quad ?$$

## Some results:

- [Fernández-Cara, Guerrero, Imanuvilov, Puel, 2006]: [Local exact controllability to the trajectories](#) when  $\bar{\omega} \cap \partial\Omega \neq \emptyset$ .

- Vanishing component depends on this geometric assumption.

# Reduced number of controls

We are interested in **removing** this geometric property.

- [Coron, Guerrero, 2009]: **Null controllability of the Stokes system**

$$\begin{cases} y_t - \Delta y + \nabla p = (v_1, v_2, 0) \mathbb{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega, \end{cases}$$

that is,  $\boxed{y(T)=0}$ .

# Carleman estimates and controllability

Consider the Stokes system and its adjoint:

$$\left\{ \begin{array}{ll} y_t - \Delta y + \nabla p = (\mathbf{v}_1, 0) \mathbb{1}_\omega & \text{in } Q, \\ \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 & \text{in } \Omega, \end{array} \right. \quad \left\{ \begin{array}{ll} -\varphi_t - \Delta \varphi + \nabla \pi = 0, & \text{in } Q, \\ \nabla \cdot \varphi = 0 & \text{in } Q, \\ \varphi = 0 & \text{on } \Sigma, \\ \varphi(T) = \varphi^T & \text{in } \Omega. \end{array} \right.$$

Null controllability is equivalent to the Observability inequality

$$\int_{\Omega} |\varphi(0)|^2 dx \leq C \iint_{\omega \times (0, T)} |\varphi_1|^2 dx dt, \quad \varphi = (\varphi_1, \varphi_2).$$

Important tool: Carleman estimates

$$\iint_Q \rho_1(x, t) |\varphi|^2 dx dt \leq C \iint_{\omega \times (0, T)} \rho_2(x, t) |\varphi_1|^2 dx dt$$

$\rho_1, \rho_2$  some positive weight functions,  $C$  independent of  $\varphi$ .

## How do they prove this inequality?

Method introduced in [Coron, Guerrero, 2009]:

- $\nabla \cdot \varphi = 0 \Rightarrow \Delta \pi = 0$ ,
- Look at the equation satisfied by  $\nabla \Delta \varphi_1$  and apply Carleman estimates\* (doing this eliminates the pressure),
- Use  $\nabla \cdot \varphi = 0$  to recover  $\varphi_2$  in the LHS.

\***Remark:** When applying the operator  $\nabla \Delta$ , we lose the boundary conditions. Special Carleman estimates are needed:

- [Fernández-Cara, González-Burgos, Guerrero, Puel, 2006]  
RHS in  $L^2$
- [Imanuvilov, Puel, Yamamoto, 2009]  
RHS in  $H^{-1}$

# Navier-Stokes system

We deal with the **local null controllability** of

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, 0) \mathbb{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega, \end{cases}$$

with **no assumption** on the control domain  $\emptyset \neq \omega \subset \Omega$ .

## Theorem (Guerrero, C., 2011)

For every  $T > 0$  and  $\omega \subset \Omega$ , the NS system is **locally null controllable** by a control  $v \in L^2(\omega \times (0, T))^2$  of the form  $v = (v_1, 0)$ .

- We can also choose  $v = (0, v_2)$ .
- For  $N = 3$ ,  $v = (v_1, v_2, 0)$ ,  $v = (v_1, 0, v_3)$  or  $v = (0, v_2, v_3)$ .

# Method of proof

- Linearization around zero.
- Null controllability of the [linearized system](#).  
**Main tool:** [Carleman estimate](#) for the adjoint system.
- [Inverse mapping theorem](#) to obtain the result for the nonlinear system.

# Linear system

We deal with the **null controllability** of the linearized system around 0:

$$\begin{cases} y_t - \Delta y + \nabla p = f + (v_1, 0) \mathbb{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega, \end{cases} \quad (L)$$

where  $f$  is taken to decrease exponentially to zero in  $t = T$ .

We need a suitable observability inequality for the adjoint system.

# Adjoint system

Consider the **nonhomogeneous adjoint** system:

$$\begin{cases} -\varphi_t - \Delta \varphi + \nabla \pi = g, & \nabla \cdot \varphi = 0 & \text{in } Q, \\ \varphi = 0 & & \text{on } \Sigma, \\ \varphi(T) = \varphi^T & & \text{in } \Omega, \end{cases}$$

where  $g \in L^2(Q)^2$  and  $\varphi^T \in L^2(\Omega)^2$ .

We want to show a **Carleman estimate** of the type:

$$\iint_Q \rho_1(t) |\varphi|^2 \leq C \left( \iint_Q \rho_2(t) |g|^2 + \iint_{\omega \times (0,T)} \rho_3(t) |\varphi_1|^2 \right)$$

for every  $\varphi = (\varphi_1, \varphi_2)$  solution of the adjoint system.

# Weight functions

Let  $\omega_0$  be a nonempty open set such that  $\overline{\omega_0} \subset \omega$  and  $\lambda > 1$

$$\alpha(x, t) = \frac{e^{2\lambda\|\eta\|_\infty} - e^{\lambda\eta(x)}}{\ell^8(t)} > 0, \quad \xi(x, t) = \frac{e^{\lambda\eta(x)}}{\ell^8(t)} > 0,$$

where  $\eta \in C^2(\overline{\Omega})$  and  $\ell \in C^\infty([0, T])$  are s.t.

$$|\nabla \eta| > 0 \text{ in } \overline{\Omega} \setminus \omega_0, \quad \eta > 0 \text{ in } \Omega \text{ and } \eta \equiv 0 \text{ on } \partial\Omega,$$

$$\ell(t) = t \quad \forall t \in [0, T/4], \quad \ell(t) = T - t \quad \forall t \in [3T/4, T].$$

Existence of  $\eta$  : [Fursikov, Imanuvilov, 1996].

# Carleman estimate for the adjoint system

## Proposition: Carleman inequality

There exists a constant  $C > 0$  (depending on  $\Omega$ ,  $\omega$ ,  $T$  and  $\lambda$ )

$$\begin{aligned} s^4 \iint_Q e^{-5s\alpha^*} (\xi^*)^4 |\varphi|^2 \\ \leq C \left( \iint_Q e^{-3s\alpha^*} |g|^2 + s^7 \iint_{\omega \times (0,T)} e^{-2s\alpha - 3s\alpha^*} \xi^7 |\varphi_1|^2 \right) \end{aligned}$$

for every  $s \geq C$  and every  $\varphi = (\varphi_1, \varphi_2)$  solution of the adjoint system.

# What is different with the Stokes case?

- $g \neq 0$ .
- $\Delta\pi \neq 0$ .
- We consider de Stokes systems:

$$\begin{cases} -w_t - \Delta w + \nabla\pi_w = \rho(t)g, \nabla \cdot w = 0 \text{ in } Q, \\ w = 0 \text{ on } \Sigma, w(T) = 0 \text{ in } \Omega, \end{cases}$$

$$\begin{cases} -z_t - \Delta z + \nabla\pi_z = -\rho'(t)\varphi, \nabla \cdot z = 0 \text{ in } Q, \\ z = 0 \text{ on } \Sigma, z(T) = 0 \text{ in } \Omega, \end{cases}$$

where  $\rho(t) = e^{-3/2s\alpha^*}$  and  $\rho(t)\varphi = w + z$ .

- Now  $\Delta\pi_z = 0$  and we can apply the previous method to  $z$ .
- Regularity estimates for  $w$ .

- $-(\nabla \Delta z_1)_t - \Delta(\nabla \Delta z_1) = -\rho'(t) \nabla \Delta \varphi_1$ . No boundary conditions.
- We apply a Carleman inequality with **nonhomogeneous boundary conditions** [Imanuvilov, Puel, Yamamoto, 2009].
- Parabolic and elliptic Carleman estimates to obtain the **local term in  $z_1$** .
- Regularity estimates for Stokes to **eliminate the boundary terms**.

# Null controllability of the linear system

We need weights that **do not vanish at  $t = 0$** .

Let

$$\tilde{\ell}(t) = \begin{cases} \|\ell\|_{\infty} & 0 \leq t \leq T/2, \\ \ell(t) & T/2 < t \leq T. \end{cases}$$

We define  $\beta$  and  $\gamma$  as  $\alpha$  and  $\xi$ .

$$\begin{aligned} \|\varphi(0)\|_{L^2(\Omega)^2}^2 + \iint_Q e^{-5s\beta^*} (\gamma^*)^4 |\varphi|^2 \\ \leq C \left( \iint_Q e^{-3s\beta^*} |g|^2 + \iint_{\omega \times (0, T)} e^{-2s\hat{\beta} - 3s\beta^*} \hat{\gamma}^7 |\varphi_1|^2 \right). \end{aligned}$$

This is proved using classical **energy estimates** for Stokes and the **previous Carleman inequality**.

Recall the linear system:

$$\begin{cases} y_t - \Delta y + \nabla p = f + (v_1, 0) \mathbf{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega. \end{cases}$$

If

$$\iint_Q e^{5s\beta^*} (\gamma^*)^{-4} |f|^2 < +\infty,$$

then we can prove that there exists a control  $v_1$  such that  $y(T)=0$ .  
Furthermore,

$$\iint_Q e^{3s\beta^*} |y|^2 + \iint_Q e^{2s\hat{\beta}+3s\beta^*} \hat{\gamma}^{-7} |v_1|^2 \mathbf{1}_\omega < +\infty,$$

which gives that  $y$  goes to zero at  $T$  exponentially (so does the control).

# Controllability of the NS system

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = (v_1, 0)\mathbb{1}_\omega, & \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & & \text{on } \Sigma, \\ y(0) = y^0 & & \text{in } \Omega. \end{cases}$$

We consider the operator:

$$\mathcal{A}(y, p, v_1) = (y_t - \Delta y + (y \cdot \nabla)y + \nabla p - (v_1, 0)\mathbb{1}_\omega, y(0))$$

Of class  $\mathcal{C}^1$  between special spaces (where in particular  $y(T)=0$ ).

$$\mathcal{A}'(0, 0, 0)(y, p, v_1) = (y_t - \Delta y + \nabla p - (v_1, 0)\mathbb{1}_\omega, y(0))$$

is **surjective** by the **null controllability of the linear system**.

**Inverse mapping theorem** around  $(0,0,0)$  gives the result for NS, i.e., there exists  $\delta > 0$  such that if  $\|y^0\| < \delta$ , then there exists  $(y, p, v_1)$  such that

$$\mathcal{A}(y, p, v_1) = (0, y^0).$$

## Extension: Boussinesq system

Now we consider the Boussinesq system:

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = v \mathbb{1}_\omega + \theta e_3, & \nabla \cdot y = 0 & \text{in } Q, \\ \theta_t - \Delta \theta + y \cdot \nabla \theta = v_0 \mathbb{1}_\omega & & \text{in } Q, \\ y = 0, \theta = 0 & & \text{on } \Sigma, \\ y(0) = y^0, \theta(0) = \theta^0 & & \text{in } \Omega. \end{cases}$$

**Goal:** To find a control  $v \in L^2(\omega \times (0, T))^3$  of the form  $v = (v_1, 0, 0)$ , and  $v_0 \in L^2(\omega \times (0, T))$  such that

$$y(T) = 0 \text{ and } \theta(T) = \bar{\theta}(T)$$

where

$$\begin{cases} \nabla \bar{p} = \bar{\theta} e_3 & \text{in } Q, \\ \bar{\theta}_t - \Delta \bar{\theta} = 0 & \text{in } Q, \\ \bar{\theta} = 0 \text{ on } \Sigma, \bar{\theta}(0) = \bar{\theta}^0 & \text{in } \Omega, \end{cases}$$

i.e., local controllability to the trajectory  $(0, \bar{p}, \bar{\theta})$ .

### Theorem (C., 2011)

For every  $T > 0$  and  $\omega \subset \Omega$ , the Boussinesq system is **locally controllable to the trajectory**  $(0, \bar{p}, \bar{\theta})$  by controls  $v_0 \in L^2(\omega \times (0, T))$  and  $v \in L^2(\omega \times (0, T))^3$  of the form  $v = (v_1, 0, 0)$ .

- We can also choose  $v = (0, v_2, 0)$ .
- For  $N = 2$ ,  $v \equiv 0$ : No control is needed in the fluid equation.

Linearized system around  $(0, \bar{p}, \bar{\theta})$ :

$$\begin{cases} y_t - \Delta y + \nabla p = f + (v_1, 0, 0) \mathbb{1}_\omega + \theta e_3, \nabla \cdot y = 0 & \text{in } Q, \\ \theta_t - \Delta \theta + y \cdot \nabla \bar{\theta} = f_0 + v_0 \mathbb{1}_\omega & \text{in } Q, \\ y = 0, \theta = 0 & \text{on } \Sigma, \\ y(0) = y^0, \theta(0) = \theta^0 & \text{in } \Omega, \end{cases}$$

where  $f$  and  $f_0$  will be taken to decrease exponentially to zero in  $T$ .

The (nonhomogeneous) adjoint system:

$$\begin{cases} -\varphi_t - \Delta \varphi + \nabla \pi = g - \psi \nabla \bar{\theta}, \nabla \cdot \varphi = 0 & \text{in } Q, \\ -\psi_t - \Delta \psi = g_0 + \varphi_3 & \text{in } Q, \\ \varphi = 0, \psi = 0 & \text{on } \Sigma, \\ \varphi(T) = \varphi^T, \psi(T) = \psi^T & \text{in } \Omega, \end{cases}$$

where  $g \in L^2(Q)^3$ ,  $g_0 \in L^2(Q)$ ,  $\varphi^T \in L^2(\Omega)^3$  and  $\psi^T \in L^2(\Omega)$ .

We prove a Carleman estimate of the type

$$\iint_Q \rho_1(t)(|\varphi|^2 + |\psi|^2) \leq C \left( \iint_Q \rho_2(t)(|g|^2 + |g_0|^2) + \iint_{\omega \times (0, T)} \rho_3(t)(|\varphi_1|^2 + |\psi|^2) \right)$$

for every  $(\varphi, \psi) = (\varphi_1, \varphi_2, \varphi_3, \psi)$  solution of the adjoint system.

**How do we prove it?**

- With the previous method, we obtain local terms of  $\varphi_1$  and  $\varphi_3$ .
- We eliminate  $\varphi_3$  using the equation.

$$\varphi_3 = -\psi_t - \Delta\psi - g_0.$$

- For  $\psi$ , we use the classical Carleman for the heat equation.

# Insensitizing controls for Navier-Stokes system

We consider the problem of **insensitizing controls** for the NS system:

$$\begin{cases} y_t - \Delta y + (y \cdot \nabla)y + \nabla p = f + v \mathbb{1}_\omega, \nabla \cdot y = 0 & \text{in } Q, \\ y = 0 & \text{on } \Sigma, \\ y(0) = y^0 + \tau \hat{y}^0 & \text{in } \Omega, \end{cases} \quad (\text{S})$$

where  $\tau$  is a small constant and  $\|\hat{y}^0\|_{L^2(\Omega)^N} = 1$ . Both are **unknown**.

**Insensitizing control problem:** To find a control  $v \in L^2(\omega \times (0, T))^N$  such that the functional (**Sentinel**)

$$J(y) = \iint_{\mathcal{O} \times (0, T)} |y|^2 dx dt, \quad \mathcal{O} \subset \Omega \quad (\text{Observation set})$$

is not affected by the **uncertainty of the initial data**, that is,

$$\left. \frac{\partial J(y)}{\partial \tau} \right|_{\tau=0} = 0, \quad \forall \hat{y}^0 \in L^2(\Omega)^N \text{ s.t. } \|\hat{y}^0\|_{L^2(\Omega)^N} = 1.$$

# Some previous works

- Heat equation: [Bodart, Fabre, 1995], [de Teresa, 2000]
- Gradient as Sentinel: [Guerrero, 2007]
- Stokes: [Guerrero, 2007]
- Navier-Stokes: [Gueye, 2010]

We are interested in controls with **one vanishing component**.

# A cascade Navier-Stokes system

The previous condition is equivalent to the following **null controllability problem**: To find a control  $v = (v_1, 0)$  such that  $z(0) = 0$ , where

$$\begin{cases} w_t - \Delta w + (w \cdot \nabla)w + \nabla p^0 = f + (v_1, 0)\mathbb{1}_\omega, \nabla \cdot w = 0 & \text{in } Q, \\ -z_t - \Delta z + (z \cdot \nabla^t w) - (w \cdot \nabla)z + \nabla q = w\mathbb{1}_\mathcal{O}, \nabla \cdot z = 0 & \text{in } Q, \\ w = z = 0 & \text{on } \Sigma, \\ w(0) = y^0, z(T) = 0 & \text{in } \Omega. \end{cases}$$

## Theorem (Gueye, C., 2012)

Assume  $y^0 = 0$  and  $\mathcal{O} \cap \omega \neq \emptyset$ . There exists  $\delta > 0$  such that if  $\|e^{K/t^{10}} f\|_{L^2(Q)^2} < \delta$ , there exists a control  $v_1 \in L^2(\omega \times (0, T))$  such that  $z(0) = 0$ .

- We can also choose  $v = (0, v_2)$ .
- For  $N = 3$ :  $v = (v_1, v_2, 0)$ ,  $v = (v_1, 0, v_3)$  or  $v = (0, v_2, v_3)$ .

# Same strategy as before

Null controllability of the linearized system around 0:

$$\begin{cases} w_t - \Delta w + \nabla p^0 = f^0 + (v_1, 0) \mathbb{1}_\omega, \nabla \cdot w = 0 & \text{in } Q, \\ -z_t - \Delta z + \nabla q = f^1 + w \mathbb{1}_\mathcal{O}, \nabla \cdot z = 0 & \text{in } Q, \\ w = z = 0 & \text{on } \Sigma, \\ w(0) = 0, z(T) = 0 & \text{in } \Omega, \end{cases}$$

where  $f^0$  and  $f^1$  decrease exponentially to zero at  $t = 0$ .

- The control acts on  $z$  through  $w$ .

As before, we want to show an estimate of the form

$$\iint_Q \rho_1(t)(|\varphi|^2 + |\psi|^2) \leq C \left( \iint_Q \rho_2(t)(|g^0|^2 + |g^1|^2 + |\nabla g^1|^2) + \iint_{\omega \times (0, T)} \rho_3(t)|\varphi_1|^2 \right)$$

where  $(\varphi, \psi) = (\varphi_1, \varphi_2, \psi)$  is the solution of the adjoint system:

$$\begin{cases} -\varphi_t - \Delta \varphi + \nabla \pi = g^0 + \psi \mathbf{1}_O, & \text{in } Q, \\ \psi_t - \Delta \psi + \nabla \kappa = g^1, & \text{in } Q, \\ \nabla \cdot \varphi = \nabla \cdot \psi = 0, \text{ in } Q, \varphi = \psi = 0 \text{ on } \Sigma \\ \varphi(T) = 0, \psi(0) = \psi^0 & \text{in } \Omega. \end{cases}$$

- $g^1 \in L^2(0, T; H_0^1(\Omega)^2)$  with  $\nabla \cdot g^1 = 0$ .

# Idea of proof

- **Main idea:** To combine Carleman inequalities for  $\psi$  and  $\varphi$ , and estimate the local term in  $\psi$  by local term  $\varphi_1$ .
- For  $\varphi$ , we use the Carleman for NS.
- Because of the pressure term, we need a Carleman for  $\psi$  with **local term** in  $\Delta\psi_1$ .
- Need to apply the operator  $\nabla\nabla\Delta$  to the equation satisfied by  $\psi_1$ . **More regularity needed** for  $\psi$  (and  $g^1$ ).
- Use the equation

$$\Delta\psi_1 = -\Delta\varphi_{1,t} - \Delta^2\varphi_1 + \partial_1\nabla \cdot g^0 - \Delta g_1^0$$

to eliminate the local term  $\Delta\psi_1$ .

# Final comments

- What about controllability to trajectories?

$$-\varphi_t - \Delta\varphi + \bar{y} \cdot D\varphi + \nabla\pi = g.$$

Terms in  $\varphi_2$  that we do not know how to estimate.

- What about [two vanishing components](#), e.g.,  $v = (v_1, 0, 0)$ ?  
[P. Lissy, 2012]: [Return method](#).
- Other boundary conditions: Navier-slip.
- Insensitizing controls for Boussinesq system.
- Inverse problems? Observations in one less direction?

Thank you for your attention
